

While the week 1 focused on working of how the app looks, week 2 started towards making it interactive and working. This week was mainly about learning javascript, which adds functionality to the web-page. During this week, I learnt about:

- Javascript basics
- Variables, data types
- Alerts, prompts, confirm
- Type conversions
- Operators and math
- Loops
- Conditional statements and logical operators
- Functions and arrow functions
- DOM Manipulation
- querySelector
- events

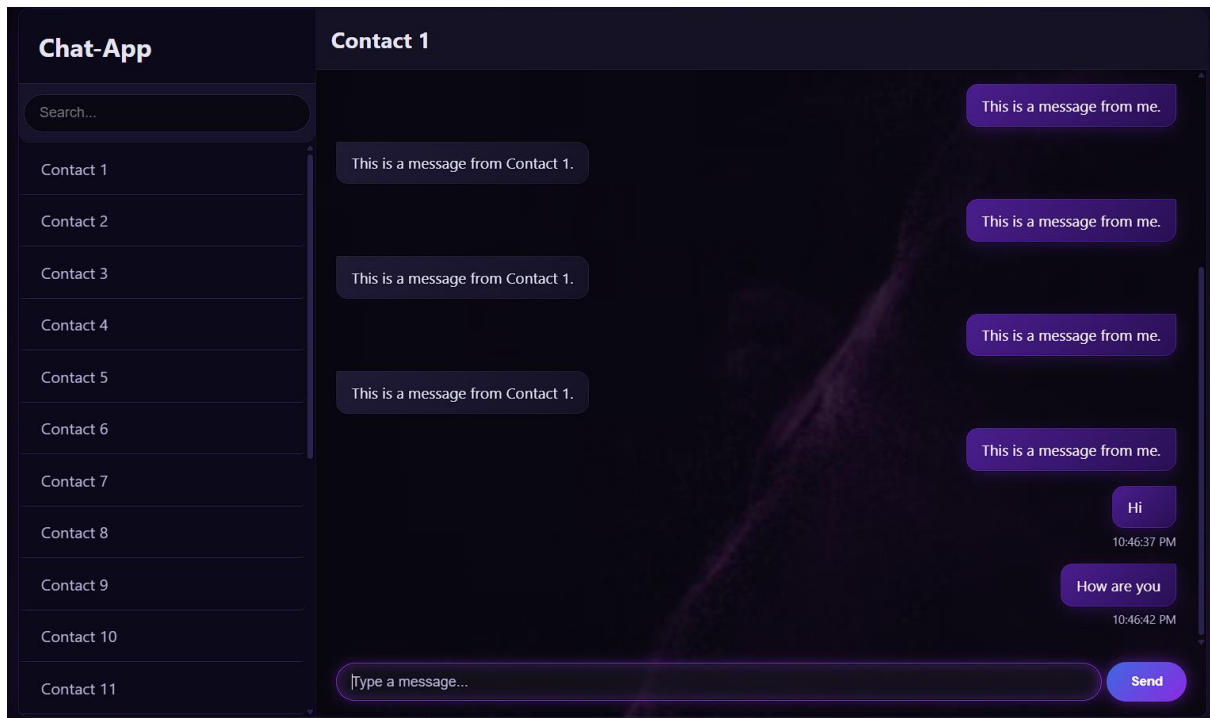

Learning basic javascript didn't feel like nothing new, knowledge from C++ helped to pace up that part. The main thing that I learnt was about DOM Manipulation of how we can work on certain elements.

This week's task was basically to make the send button more function and the app more dynamic. Worked on a send message function which takes in the text from input and adds it into a const variable. It then creates a new div element giving it the same class as other texts used in CSS file so that it takes on the same appearance.

Also added date using Date() function just below the text bubble to show when the text was sent. Pressing send appends the newly created div element to previous message list, clears the input bar and scrolls accordingly corresponding to the new message. Send also works by pressing enter, this was done using event listener keydown.

One problem I had noticed was even when I wrote about mentioning the time of the message sent, initially it didn't actually appear on the app. It was later that I understand that I had not applied any css effect to it, and it was being blended with the dark background, hence not visible.

It was an easy fix by applying the appropriate css to that span element.

Notice how the recent texts have time below them written in white.
